

Local Man Eats Toxic Fly; Dies of Heart Attack

Eat a Fly Challenge Goes Wrong

A young man by the name of Carson Calmee, living in the town of Sussin, PA, recently died of a **fatal heart attack** after eating what he believed to be a fruit fly for what his family claims to be "One of his Youtube 'Challenge Videos'." His younger brother, George Calmee, claims that Carson was acting very strange before he started showing symptoms of a heart attack. In an interview, George claimed, "Carson was acting a little sus after I recorded him eating the fly and we finished the video. He was really sweaty and was saying weird stuff like 'C'mere George' in a creepy voice. When he started throwing up, i knew there must have been something wrong with that fly, man, so i called for an ambulance, but they were too late. I dont know what was up in that fly, but it ain't normal."

Implanted Toxins

It turns out that the fly he ate was not an American fruit fly, but a Russian species dubbed *glizzus gladicatus* by a team of scientists that are currently researching the species and tracking down how the toxins led to a heart attack in this man. The compound that the team believes to have caused the heart failure in Calmee is a mixture of the man-made toxin *Gape Oshin*, developed by Japanese scientists looking to use it on frogs, *Doxorubicin*, and *Arsenic*. The scientists believe that this mixture has injected into the fly through its abdomen, causing it to look bloated. The team also found significant traces of COVID-20 in Calmee's bloodstream, which they believe may have weakened his immune system prior to consuming the fly.

Is Russia Using Bioweapons Against Us?

The evidence found by scientists may prove that the Russian government is **conspiring against us** and sending **bioweapons our way**. For an in depth documentary on this new potential bioweapon, click [here](#).
